

Composition of Operations

- Can build expressions using multiple operations
- Example: $\sigma_{A=C}(r \times s)$
- $r \times s$

A	B	C	D	E
α	1	α	10	a
α	1	β	10	a
α	1	β	20	b
α	1	γ	10	b
β	2	α	10	a
β	2	β	10	a
β	2	β	20	b
β	2	γ	10	b

- $\sigma_{A=C}(r \times s)$

A	B	C	D	E
α	1	α	10	a
β	2	β	10	a
β	2	β	20	b

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.25 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find all loans of over \$1200

$$\sigma_{amount > 1200}(loan)$$

- Find the loan number for each loan of an amount greater than \$1200

$$\Pi_{loan_number}(\sigma_{amount > 1200}(loan))$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.28 ©Silberschatz, Korth and Sudarshan

Rename Operation

- Allows us to name, and therefore to refer to, the results of relational-algebra expressions.
- Allows us to refer to a relation by more than one name.
- Example:

$$\rho_X(E)$$

returns the expression E under the name X

- If a relational-algebra expression E has arity n , then

$$\rho_{X(A_1, A_2, \dots, A_n)}(E)$$

returns the result of expression E under the name X , and with the attributes renamed to A_1, A_2, \dots, A_n .

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.26 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find the names of all customers who have a loan, an account, or both, from the bank

$$\Pi_{customer_name}(borrower) \cup \Pi_{customer_name}(depositor)$$

- Find the names of all customers who have a loan and an account at bank.

$$\Pi_{customer_name}(borrower) \cap \Pi_{customer_name}(depositor)$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.29 ©Silberschatz, Korth and Sudarshan

Banking Example

branch (*branch_name*, *branch_city*, *assets*)

customer (*customer_name*, *customer_street*, *customer_city*)

account (*account_number*, *branch_name*, *balance*)

loan (*loan_number*, *branch_name*, *amount*)

depositor (*customer_name*, *account_number*)

borrower (*customer_name*, *loan_number*)

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.27 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find the names of all customers who have a loan at the Perryridge branch.

$$\Pi_{customer_name}(\sigma_{branch_name = \text{Perryridge}}(\sigma_{borrower.loan_number = loan.loan_number}(borrower \times loan)))$$

- Find the names of all customers who have a loan at the Perryridge branch but do not have an account at any branch of the bank.

$$\Pi_{customer_name}(\sigma_{branch_name = \text{Perryridge}}(\sigma_{borrower.loan_number = loan.loan_number}(borrower \times loan))) - \Pi_{customer_name}(depositor)$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.30 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find the names of all customers who have a loan at the Perryridge branch.
 - Query 1

$$\Pi_{\text{customer_name}}(\sigma_{\text{branch_name} = \text{"Perryridge"}}(\sigma_{\text{borrower.loan_number} = \text{loan.loan_number}}(\text{borrower} \times \text{loan})))$$
 - Query 2

$$\Pi_{\text{customer_name}}(\sigma_{\text{loan.loan_number} = \text{borrower.loan_number}}((\sigma_{\text{branch_name} = \text{"Perryridge"}}(\text{loan})) \times \text{borrower}))$$

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.31 ©Silberschatz, Korth and Sudarshan

Additional Operations

We define additional operations that do not add any power to the relational algebra, but that simplify common queries.

- Set intersection
- Natural join
- Division
- Assignment

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.34 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find the largest account balance
 - Strategy:
 - Find those balances that are *not* the largest
 - Rename *account* relation as *d* so that we can compare each account balance with all others
 - Use set difference to find those account balances that were *not* found in the earlier step.
 - The query is:

$$\Pi_{\text{balance}}(\text{account}) - \Pi_{\text{account.balance}}(\sigma_{\text{account.balance} < \text{d.balance}}(\text{account} \times \rho_d(\text{account})))$$

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.32 ©Silberschatz, Korth and Sudarshan

Set-Intersection Operation

- Notation: $r \cap s$
- Defined as:

$$r \cap s = \{t \mid t \in r \text{ and } t \in s\}$$
- Assume:
 - r, s have the *same arity*
 - attributes of r and s are compatible
- Note: $r \cap s = r - (r - s)$

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.35 ©Silberschatz, Korth and Sudarshan

Formal Definition

- A basic expression in the relational algebra consists of either one of the following:
 - A relation in the database
 - A constant relation
- Let E_1 and E_2 be relational-algebra expressions; the following are all relational-algebra expressions:
 - $E_1 \cup E_2$
 - $E_1 - E_2$
 - $E_1 \times E_2$
 - $\sigma_P(E_1)$, P is a predicate on attributes in E_1
 - $\Pi_S(E_1)$, S is a list consisting of some of the attributes in E_1
 - $\rho_X(E_1)$, X is the new name for the result of E_1

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.33 ©Silberschatz, Korth and Sudarshan

Set-Intersection Operation – Example

- Relation r, s :

A	B
α	1
α	2
β	1

$$r$$

A	B
α	2
β	3

$$s$$
- $r \cap s$

A	B
α	2

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suell for CS308, Polytechnic University, Fall 2005 2.36 ©Silberschatz, Korth and Sudarshan

Natural-Join Operation

- Notation: $r \bowtie s$
- Let r and s be relations on schemas R and S respectively. Then $r \bowtie s$ is a relation on schema $R \cup S$ obtained as follows:
 - Consider each pair of tuples t_r from r and t_s from s .
 - If t_r and t_s have the same value on each of the attributes in $R \cap S$, add a tuple t to the result, where
 - t has the same value as t_r on r
 - t has the same value as t_s on s
- Example:
 - $R = (A, B, C, D)$
 - $S = (E, B, D)$
 - Result schema = (A, B, C, D, E)
 - $r \bowtie s$ is defined as:

$$\Pi_{r.A, r.B, r.C, r.D, s.E}(\sigma_{r.B=s.B \wedge r.D=s.D}(r \times s))$$

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.37 ©Silberschatz, Korth and Sudarshan

Division Operation – Example

- Relations r, s :

A	B
α	1
α	2
α	3
β	1
γ	1
δ	3
δ	4
ϵ	6
ϵ	1
β	2

B
1
2

A
α
β

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.40 ©Silberschatz, Korth and Sudarshan

Natural Join Operation – Example

- Relations r, s :

A	B	C	D
α	1	α	a
β	2	γ	a
γ	4	β	b
α	1	γ	a
δ	2	β	b

B	D	E
1	a	α
3	a	β
1	a	γ
2	b	δ
3	b	ϵ

A	B	C	D	E
α	1	α	a	α
α	1	α	a	α
α	1	γ	a	α
α	1	γ	a	α
δ	2	β	b	δ

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.38 ©Silberschatz, Korth and Sudarshan

Another Division Example

- Relations r, s :

A	B	C	D	E
α	a	α	a	1
α	a	γ	a	1
α	a	γ	b	1
β	a	γ	a	1
β	a	γ	b	3
γ	a	γ	a	1
γ	a	γ	b	1
γ	a	β	b	1

D	E
a	1
b	1

A	B	C
α	a	γ
γ	a	γ

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.41 ©Silberschatz, Korth and Sudarshan

Division Operation

- Notation: $r \div s$
- Suited to queries that include the phrase "for all".
- Let r and s be relations on schemas R and S respectively where
 - $R = (A_1, \dots, A_m, B_1, \dots, B_n)$
 - $S = (B_1, \dots, B_n)$
- The result of $r \div s$ is a relation on schema $R - S = (A_1, \dots, A_m)$

$$r \div s = \{t \mid t \in \Pi_{R-S}(r) \wedge \forall u \in s (tu \in r)\}$$
- Where tu means the concatenation of tuples t and u to produce a single tuple

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.39 ©Silberschatz, Korth and Sudarshan

Division Operation (Cont.)

- Property
 - Let $q = r \div s$
 - Then q is the largest relation satisfying $q \times s \subseteq r$
- Definition in terms of the basic algebra operation
Let $r(R)$ and $s(S)$ be relations, and let $S \subseteq R$

$$r \div s = \Pi_{R-S}(r) - \Pi_{R-S}((\Pi_{R-S}(r) \times s) - \Pi_{R-S,S}(r))$$
- To see why:
 - $\Pi_{R-S}(r)$ simply reorders attributes of r
 - $\Pi_{R-S}((\Pi_{R-S}(r) \times s) - \Pi_{R-S,S}(r))$ gives those tuples t in $\Pi_{R-S}(r)$ such that for some tuple $u \in s$, $tu \notin r$.

Database System Concepts - 9th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.42 ©Silberschatz, Korth and Sudarshan

Assignment Operation

- The assignment operation (\leftarrow) provides a convenient way to express complex queries.
 - Write query as a sequential program consisting of
 - a series of assignments
 - followed by an expression whose value is displayed as a result of the query.
 - Assignment must always be made to a temporary relation variable.
- Example: Write $r \bowtie s$ as

$$\begin{aligned} temp1 &\leftarrow \Pi_{R,S}(r) \\ temp2 &\leftarrow \Pi_{R,S}((temp1 \times s) - \Pi_{R,S,S}(r)) \\ result &= temp1 - temp2 \end{aligned}$$
 - The result to the right of the \leftarrow is assigned to the relation variable on the left of the \leftarrow .
 - May use variable in subsequent expressions.

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.43 ©Silberschatz, Korth and Sudarshan

Example Queries

- Find all customers who have an account at all branches located in Brooklyn city.

$$\begin{aligned} &\Pi_{customer_name, branch_name}(depositor \bowtie account) \\ &+ \Pi_{branch_name}(\sigma_{branch_city = "Brooklyn"}(branch)) \end{aligned}$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.46 ©Silberschatz, Korth and Sudarshan

Bank Example Queries

- Find the names of all customers who have a loan and an account at bank.

$$\Pi_{customer_name}(borrower) \cap \Pi_{customer_name}(depositor)$$
- Find the name of all customers who have a loan at the bank and the loan amount

$$\Pi_{customer_name, loan_number, amount}(borrower \bowtie loan)$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.44 ©Silberschatz, Korth and Sudarshan

Extended Relational-Algebra-Operations

- Generalized Projection
- Aggregate Functions
- Outer Join

Note: these operations increase the power of relational algebra!

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.47 ©Silberschatz, Korth and Sudarshan

Bank Example Queries

- Find all customers who have an account from at least the "Downtown" and the Uptown" branches.
 - Query 1

$$\begin{aligned} &\Pi_{customer_name}(\sigma_{branch_name = "Downtown"}(depositor \bowtie account)) \cap \\ &\Pi_{customer_name}(\sigma_{branch_name = "Uptown"}(depositor \bowtie account)) \end{aligned}$$
 - Query 2

$$\begin{aligned} &\Pi_{customer_name, branch_name}(depositor \bowtie account) \\ &+ \rho_{temp(branch_name)}(\{("Downtown"), ("Uptown")\}) \end{aligned}$$

Note that Query 2 uses a constant relation.

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.45 ©Silberschatz, Korth and Sudarshan

Generalized Projection

- Extends the projection operation by allowing arithmetic functions to be used in the projection list.

$$\Pi_{F_1, F_2, \dots, F_n}(E)$$
 - E is any relational-algebra expression
 - Each of F_1, F_2, \dots, F_n are arithmetic expressions involving constants and attributes in the schema of E .
 - Given relation $credit_info(customer_name, limit, credit_balance)$, find how much more each person can spend:

$$\Pi_{customer_name, limit - credit_balance}(credit_info)$$

Database System Concepts - 5th Edition, June 15, 2005
Modified by T. Suel for CS308, Polytechnic University, Fall 2005 2.48 ©Silberschatz, Korth and Sudarshan

Aggregate Functions and Operations

- Aggregate function takes a collection of values and returns a single value as a result.
 - avg: average value
 - min: minimum value
 - max: maximum value
 - sum: sum of values
 - count: number of values
- Aggregate operation in relational algebra

$$G_1, G_2, \dots, G_n \left\{ F_1(A_1), F_2(A_2, \dots, F_n(A_n)) \right\} (E)$$
 - E is any relational-algebra expression
 - G_1, G_2, \dots, G_n is a list of attributes on which to group (can be empty)
 - Each F_i is an aggregate function
 - Each A_i is an attribute name

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.49 ©Silberschatz, Korth and Sudarshan

Aggregate Functions (Cont.)

- Result of aggregation does not have a name
 - Can use rename operation to give it a name
 - For convenience, we permit renaming as part of aggregate operation

$branch_name \mathcal{G} sum(balance) \text{ as } sum_balance (account)$

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.52 ©Silberschatz, Korth and Sudarshan

Aggregate Operation – Example

- Relation r :

A	B	C
α	α	7
α	β	7
β	β	3
β	β	10
- $\mathcal{G}_{sum(c)}(r)$

sum(c)
27

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.50 ©Silberschatz, Korth and Sudarshan

Outer Join

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples from one relation that does not match tuples in the other relation to the result of the join.
- Uses *null* values:
 - *null* signifies that the value is unknown or does not exist
 - All comparisons involving *null* are (roughly speaking) false by definition.
 - We shall study precise meaning of comparisons with nulls later

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.53 ©Silberschatz, Korth and Sudarshan

Aggregate Operation – Example

- Relation *account* grouped by *branch-name*:

branch_name	account_number	balance
Perryridge	A-102	400
Perryridge	A-201	900
Brighton	A-217	750
Brighton	A-215	750
Redwood	A-222	700
- $branch_name \mathcal{G} sum(balance) (account)$

branch_name	sum(balance)
Perryridge	1300
Brighton	1500
Redwood	700

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.51 ©Silberschatz, Korth and Sudarshan

Outer Join – Example

- Relation *loan*

loan_number	branch_name	amount
L-170	Downtown	3000
L-230	Redwood	4000
L-260	Perryridge	1700
- Relation *borrower*

customer_name	loan_number
Jones	L-170
Smith	L-230
Hayes	L-155

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.54 ©Silberschatz, Korth and Sudarshan

Outer Join – Example

- Inner Join
 $loan \bowtie Borrower$

loan_number	branch_name	amount	customer_name
L-170	Downtown	3000	Jones
L-230	Redwood	4000	Smith
- Left Outer Join
 $loan \leftarrow \bowtie Borrower$

loan_number	branch_name	amount	customer_name
L-170	Downtown	3000	Jones
L-230	Redwood	4000	Smith
L-260	Perryridge	1700	null

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.55 ©Silberschatz, Korth and Sudarshan

Null Values

- Comparisons with null values return the special truth value: *unknown*
 - If *false* was used instead of *unknown*, then $not(A < 5)$ would not be equivalent to $A \geq 5$
- Three-valued logic using the truth value *unknown*:
 - OR: (*unknown* or *true*) = *true*,
 (*unknown* or *false*) = *unknown*,
 (*unknown* or *unknown*) = *unknown*
 - AND: (*true* and *unknown*) = *unknown*,
 (*false* and *unknown*) = *false*,
 (*unknown* and *unknown*) = *unknown*
 - NOT: (*not unknown*) = *unknown*
 - In SQL “*P* is *unknown*” evaluates to true if predicate *P* evaluates to *unknown*
- Result of select predicate is treated as *false* if it evaluates to *unknown*

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.58 ©Silberschatz, Korth and Sudarshan

Outer Join – Example

- Right Outer Join
 $loan \rightarrow \bowtie borrower$

loan_number	branch_name	amount	customer_name
L-170	Downtown	3000	Jones
L-230	Redwood	4000	Smith
L-155	null	null	Hayes
- Full Outer Join
 $loan \ltimes borrower$

loan_number	branch_name	amount	customer_name
L-170	Downtown	3000	Jones
L-230	Redwood	4000	Smith
L-260	Perryridge	1700	null
L-155	null	null	Hayes

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.56 ©Silberschatz, Korth and Sudarshan

Modification of the Database

- The content of the database may be modified using the following operations:
 - Deletion
 - Insertion
 - Updating
- All these operations are expressed using the assignment operator.

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.59 ©Silberschatz, Korth and Sudarshan

Null Values

- It is possible for tuples to have a null value, denoted by *null*, for some of their attributes
- null* signifies an unknown value or that a value does not exist.
- The result of any arithmetic expression involving *null* is *null*.
- Aggregate functions simply ignore null values (as in SQL)
- For duplicate elimination and grouping, null is treated like any other value, and two nulls are assumed to be the same (as in SQL)

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.57 ©Silberschatz, Korth and Sudarshan

Deletion

- A delete request is expressed similarly to a query, except instead of displaying tuples to the user, the selected tuples are removed from the database.
- Can delete only whole tuples; cannot delete values on only particular attributes
- A deletion is expressed in relational algebra by:

$$r \leftarrow r - E$$
 where *r* is a relation and *E* is a relational algebra query.

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.60 ©Silberschatz, Korth and Sudarshan

Deletion Examples

- Delete all account records in the Perryridge branch.

$$\text{account} \leftarrow \text{account} - \sigma_{\text{branch_name} = \text{"Perryridge"}}(\text{account})$$
- Delete all loan records with amount in the range of 0 to 50

$$\text{loan} \leftarrow \text{loan} - \sigma_{\text{amount} \geq 0 \text{ and } \text{amount} \leq 50}(\text{loan})$$
- Delete all accounts at branches located in Needham.

$$r_1 \leftarrow \sigma_{\text{branch_city} = \text{"Needham"}}(\text{account} \bowtie \text{branch})$$

$$r_2 \leftarrow \pi_{\text{branch_name}, \text{account_number}, \text{balance}}(r_1)$$

$$r_3 \leftarrow \pi_{\text{customer_name}, \text{account_number}}(r_2 \bowtie \text{depositor})$$

$$\text{account} \leftarrow \text{account} - r_2$$

$$\text{depositor} \leftarrow \text{depositor} - r_3$$

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.61 ©Silberschatz, Korth and Sudarshan

Updating

- A mechanism to change a value in a tuple without changing *all* values in the tuple
- Use the generalized projection operator to do this task

$$r \leftarrow \prod_{F_1, F_2, \dots, F_j}(r)$$
- Each F_j is either
 - the l^{th} attribute of r , if the l^{th} attribute is not updated, or,
 - if the attribute is to be updated F_j is an expression, involving only constants and the attributes of r , which gives the new value for the attribute

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.64 ©Silberschatz, Korth and Sudarshan

Insertion

- To insert data into a relation, we either:
 - specify a tuple to be inserted
 - write a query whose result is a set of tuples to be inserted
- in relational algebra, an insertion is expressed by:

$$r \leftarrow r \cup E$$
 where r is a relation and E is a relational algebra expression.
- The insertion of a single tuple is expressed by letting E be a constant relation containing one tuple.

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.62 ©Silberschatz, Korth and Sudarshan

Update Examples

- Make interest payments by increasing all balances by 5 percent.

$$\text{account} \leftarrow \prod_{\text{account_number}, \text{branch_name}, \text{balance} * 1.05}(\text{account})$$
- Pay all accounts with balances over \$10,000 6 percent interest and pay all others 5 percent

$$\text{account} \leftarrow \prod_{\text{account_number}, \text{branch_name}, \text{balance} * 1.06}(\sigma_{\text{BAL} > 10000}(\text{account})) \cup \prod_{\text{account_number}, \text{branch_name}, \text{balance} * 1.05}(\sigma_{\text{BAL} \leq 10000}(\text{account}))$$

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.65 ©Silberschatz, Korth and Sudarshan

Insertion Examples

- Insert information in the database specifying that Smith has \$1200 in account A-973 at the Perryridge branch.

$$\text{account} \leftarrow \text{account} \cup \{(\text{"Perryridge"}, \text{A-973}, 1200)\}$$

$$\text{depositor} \leftarrow \text{depositor} \cup \{(\text{"Smith"}, \text{A-973})\}$$
- Provide as a gift for all loan customers in the Perryridge branch, a \$200 savings account. Let the loan number serve as the account number for the new savings account.

$$r_1 \leftarrow (\sigma_{\text{branch_name} = \text{"Perryridge"}}(\text{borrower} \bowtie \text{loan}))$$

$$\text{account} \leftarrow \text{account} \cup \pi_{\text{branch_name}, \text{loan_number}, 200}(r_1)$$

$$\text{depositor} \leftarrow \text{depositor} \cup \pi_{\text{customer_name}, \text{loan_number}}(r_1)$$

Database System Concepts - 5th Edition, June 15, 2005
 Modified by T. Suel for CS338, Polytechnic University, Fall 2005 2.63 ©Silberschatz, Korth and Sudarshan
